

Careem Growth Decision Intelligence

Decision Brief Generator — AI Challenge Submission

Chosen challenge: #1 — Decision Brief Generator

Core idea: From performance data → evidence → priority → action → experiment.

Business problem

Growth teams need more than dashboards. They need a fast, auditable way to identify what matters, understand the likely driver, and decide what to do next.

Prototype

The app analyses revenue, MAU, OPU, ARPU, CAC, churn and promotion ROI, then checks configurable guardrails and produces prioritised recommendations.

Growth-manager fit

The workflow maps to plan-vs-actual tracking, funnel health, segmentation, root-cause diagnosis, growth initiatives, experimentation and revenue accountability.

AI philosophy

Calculations remain deterministic and auditable. An LLM can be added for hypothesis generation, deeper segmentation and executive narrative while remaining grounded in validated metrics.

Data safety

All data is synthetic and created solely for this challenge. No confidential Careem information is used.

100-word summary

I built a Growth Decision Intelligence prototype for Careem Food that turns raw performance data into an executive-ready decision brief. It combines KPI trends, configurable business guardrails, city performance, customer lifecycle signals and experiment design. Instead of only describing what changed, it prioritises the most important business signal, explains the evidence, recommends one next action, and defines how success should be measured. The prototype uses fully synthetic data, so no confidential information is involved. I kept the metric and prioritisation layer transparent and auditable, while designing it so an LLM can later add richer root-cause hypotheses, segmentation analysis and executive storytelling without inventing data.

Submission assets

Asset	Included
Interactive Streamlit prototype	Yes — app.py
Synthetic growth dataset	Yes
Customer lifecycle dataset	Yes
Reusable insight prompt	Yes
Case study	Yes
100-word summary	Yes
